1
Question
"Last access date of users with badge 'outliers'?"
+ schema S, hint
2
Generate
LLM
cheap model → c_0
≈ 3 units, 3–5 s
3
Check & price
C1
PARSE/BIND, EXPLAIN
price $\hat{C}(e)$ before buying
DB sandbox: read-only · one SELECT · timeout · row cap
4
Adaptive evidence planner
C2
partially observed state s
c_0 PB VP EX
c_1 PB VP EX
dashed = not observed (unknown)
Accept
$V(s)$
stop when nothing pays
LLM action
$Q - \lambda C$
resample repair(E) switch model
Observe
$G_z > \lambda \hat{C}$
value probe bounded exec on one cand.
value of information $G_s(s,e) = E_z[U_s(s \oplus z)] - U_s(s) \geq 0$
worth buying only if it can change the next decision
act, observe, re-plan
5
Select
C3
result clusters
+ pairwise P
6
Answer
SQL
frozen policy
OFFLINE · periodic, on a training workload
A
Evidence-conditioned replay
every action × every observation;
REPAIR once per visible mask
{ ∅, VP, EX, VP+EX }
B
Partial-state sampling
candidate sets × random evidence masks; outcome only in targets, never features
C
Estimators
A P V
Q G $\hat{C}$
gradient-boosted, regularized
D
Calibrate (cross-fitted)
out-of-fold runs choose (λ, τ, m) per budget;
test never touched
Why price evidence?
